Bent Bolts

Thread Terminology

A. FULL DIAMETER SHANK:

Equal to major diameter of thread. Produced by cut thread or by roll thread on extruded blank. Characteristic of machine bolts and cap screws.

B. UNDERSIZED SHANK:

Equal approximately to pitch diameter of thread. Produced by roll threading a non-extruded blank. Characteristic of machine screws.

C. PITCH:

The distance from a point on the screw thread to a corresponding point on the next thread measured parallel on the axis.

D. MAJOR DIAMETER: The largest diameter of a screw thread.

E. PITCH DIAMETER: The simple, effective diameter of screw thread. Approximately half way between the major and minor diameters.

F. MINOR DIAMETER: The smallest diameter of a screw thread.

LEAD: The distance a screw thread advances axially in one turn.

CUT THREAD: Threads are cut or chased; the unthreaded portion of shank will be equal to major diameter of thread.

ROLLED THREAD: Threads are cold formed by squeezing the blank between reciprocating serrated dies. This acts to increase the major diameter of the thread over and above the diameter of unthreaded shank (if any), unless an extruded blank is used.

Classes of thread are distinguished from each other by the amounts of tolerance and allowance specified. External threads or bolts are designated with the suffix "A"; internal or nut threads with "B".

CLASSES 1A and 1B: For work of rough commercial quality where loose fit for spin-on-assembly is desirable.

CLASSES 2A and 2B: The recognized standard for normal production of the great bulk of commercial bolts, nuts and screws.

CLASSES 3A and 3B: Used where a closed fit between mating parts for high quality work is required.

CLASS 4: A theoretical rather than practical class, now obsolete.

CLASS 5: For a wrench fit. Used principally for studs and their mating tapped holes. A force fit requiring the application of high torque for semi-permanent assembly.

SLOT	PHILLIPS	SLOTTED PHILLIPS COMBO	SQUARE	PHILLIPS SQUARE COMBO	PHILLIPS HEX HEAD	SLOTTED HEX	SIX LOBE

TYPES OF BOLT AND SCREW HEADS

	<p>PAN HEAD: Recommended for new designs to replace round, truss and binding heads. Provides a low large diameter head, but with characteristically high outer edge along the outer periphery of the head where drive action is most effective for high tightening torques. Slightly different head contour where supplied with recessed head. See dotted line.</p>
	<p>ROUND HEAD: Not recommended for new design (see pan head). This head was the most universally used design in the past.</p>
	<p>FILLISTER HEAD: The standard oval fillister head has a smaller diameter than the round head, but is higher with a correspondingly deeper slot. The small diameter head increases the pressure applied on the smaller area and can be assembled close to flanges and raised surfaces</p>
	<p>BINDING HEAD (Straight Side): Most generally used in electrical and radio work because of its identifying undercut beneath the head, which binds and eliminates fraying of stranded wire. A medium - low head with ordinarily sufficient bearing surface. Not recommended as a Phillips Recessed head – see Pan Head for better functional design.</p>
	<p>TRUSS HEAD: Also known as oven head, stove head, and oval binding head. A low, large diameter head that can be used to cover larger diameter clearance holes in sheet metal when additional play in assembly tolerance is required.</p>
	<p>ONE-WAY HEAD: This tamper-proof type of head, once assembled cannot be removed, yet is driven with a standard screwdriver.</p>
	<p>FLAT AND OVAL HEADS (UNDERCUT): The standard flat or oval head 80° to 82° counter sunk screw will fit a standard counterbored hole and is particularly adaptable to flush assemblies in thin stock.</p>
	<p>SQUARE SHOULDER SCREWS: An adaptation of the standard carriage bolt design. Possesses a truss head on a square shank, which resists rotation when located or driven into place.</p>

	<p>INDENTED HEXAGON: A wrench head fastener made to standard hexagon head dimensions. The hex possesses an identifying depression in the top surface of the head.</p>
	<p>INDENTED HEXAGON WASHER HEAD: The same as the standard indented hexagon head but with a washer section at the base of the head to protect the finish of the assembly from wrench disfigurement, and to economically replace a separate bolt & washer assembly.</p>
	<p>HEXAGON HEAD (TRIMMED): This is the standard type of wrench-applied hexagon head, characterized by clean, sharp corners trimmed to close tolerances. Recommended for general commercial applications.</p>
	<p>HEX FLANGE: Similar to hex washer with the exception that the top of the washer-flange shall be conical or slightly rounded within the periphery of the flange diameter. The contour of the flange edges shall be optional provided minimum flange thickness is maintained.</p>

SCREW POINT TYPES

Wood Screw

Wood screws taper gradually from the head to the point. Some wood screws are only partially threaded (depending on the length).

Tapping Screws (Type A, AB, B)

Type A point: A thread forming screw for use in thin metal .015 to .050 thick. Used with drilled, punched or nested holes in sheet metal, resin impregnated plywood, asbestos combinations, among others. Not recommended for new design.

Type AB point: A thread forming screw combining locating point of Type A with thread size and pitch of Type B. Normal limitations of type B apply.

Type B point: A thread forming screw for use in heavier metal .050 to .200 thick. Larger root diameter with finer thread pitch for light and heavy sheet metal non - ferrous castings, plastics, impregnated plywoods, asbestos combinations, and other materials.

Thread Cutting Screws (Type 1, 17, 23, 25, F)

Type 1 point: A thread cutting screw with single flute for general use. Produces a fine standard machine screw thread for field replacement.

Type 17 point: A thread cutting screw for wood with a coarse tapping screw thread and a special long sharp point fluted to capture chips.

Type 23 point: A thread cutting screw in the fine thread series offering maximum thread cutting area and excellent chip clearing, with minimum tightening torques.

Type 25 point: A thread cutting screw similar to type 23 point except with coarse Type B thread. For plastics and other soft materials with large chip clearing and cutting edges.

Type F point: A thread cutting screw with machine screw thread with blunt tapered point, having multi - cutting edges and chip cavities. For heavy gauge sheet metal, alu - minum, zinc and lead die castings, cast iron, brass and plastic.

Thread Forming Screws (Type C, CA, Tri-Round, Lo-Driv) Screws for Plastic (Tri-Round, Round)

Type C point: A thread forming screw with either coarse or fine pitch machine screw thread and blunt tapered point. Eliminates chips and permits replacement with standard screw in the field. Higher driving torque required. Usable in heavy sheet metal and diecastings.

Type CA point: A thread forming screw with either coarse or fine pitch machine screw thread. Same as Type C except with a Gimlet point. The locating point works better than Type C where holes between two adjoining pieces of sheet metal may be somewhat misaligned.

Tri-Round: A thread forming screw in mostly coarse machine screw threads. Three vertexes perform a roll - forming process to form mating threads. Much better thread forming than Type C or CA, and drives with less torque.

Lo-Driv: A thread forming screw in mostly coarse machine screw threads. The point and body design requires low end - load for starting and low drive torque for seating. The full 360 degree body above the point provides excellent strip-to-drive ratios.
